I want to get distinct column values from table where column1 = column2 AND column3 = column4. A: Try following query select \* from Table where (column1=column2 and column3=column4) If I'm reading this correctly, what you are looking for is either a JOIN or a UNION. SELECT DISTINCT col1, col2, col3 FROM (your query goes here) q JOIN ( SELECT col1, col2 FROM your query goes here ) q2 ON q2.col1 = q.col1 AND q2.col2 = q.col2 UNION SELECT col1, col2, col3 FROM your query goes here Both of these should be a more efficient method than running a GROUP BY statement with multiple column conditions. Ever since it became clear that mobile phones would come to the kitchen, I've been wishing for one that makes phone calls while cooking. Now there's one, and it looks kind of cute. The Robot Cup and Phone (\$100) is a little 82157476af
